

MTBE/TBA Contamination Treatment

Methyl tert-butyl ether (MTBE) and tert-butyl alcohol (TBA) has become a major concern of water companies and owners of sites contaminated with gasoline

Conventional methods of treating MTBE and TBA contaminated groundwater have proven to be difficult and expensive due to the high water solubility of these compounds, and their low adsorption onto activated carbon. In addition, TBA is not volatile and cannot be stripped.

However, biological treatment of contaminated groundwater has been found to be not only environmentally friendly but, if done properly, highly efficient and cost-effective.

The Solution: A Bioreactor for MTBE/TBA Treatment

Onion Environmental Equipment company, has developed a unique biological treatment system, which can easily be placed on site to treat MTBE/TBA contaminated groundwater.
